## **Research**

We are mostly done with the HTML and CSS part of the webform. This week my part was to write codes for checkbox and radio buttons so, I did research on that part. Also, we are adding JavaScript aspect to the webform next week and since I haven't worked with JavaScript before I am doing most of my research on that this week.

## **Lessons Learned & Best Practices**

Best part for this week will be the new stuff I learned like live errors on the webform.

## **Assignment Progress**

We didn't have any assignments this week except weekly meeting and journal. But, we did met twice this week to complete the Html and CSS part of the webform.

## **Prototype Activities**

We completed our Html and CSS part and next week we will start adding more JavaScript and also some features for spam entries which will either be reCAPTCHA or test questions which is completely new that was not in our prototype before.

## **Result & Conclusions**

We have tested the work we have done so far, and everything looks good so far. We added many this to the webform, but it has adapted to the Prototype well.

## **What is the problem?**

The only problem this week in my opinion will be figuring out the spam entries part since no one on the team has worked on that before.

## **Why is that a problem?**

Preventing spam entries is really important so that the bots doesn't affect our database or information. So, missing this feature in our webform is not an option.

## **How are you solving it?**

But all of us are doing our research and figuring out the process.
